

Laravel Project Requirements Document

SastaBazaar: Daily Commodity Price Monitoring & Citizen Complaint Portal

Project Title	SastaBazaar (Laravel-based Web Portal)	Target Level	Junior Software Intern
Primary Tech Stack	Laravel (PHP), Blade, MySQL, Bootstrap	Implementation Style	Monolithic (No complex JS frameworks)

1. Project Scope & Real-World Goal

In Pakistan, localized price-gouging of daily groceries (such as sugar, flour, milk, and onions) is a persistent issue. The local district administrations issue official price lists daily, but citizens have no easy way to view these lists or register quick complaints when retail shopkeepers overcharge.

SastaBazaar is a lightweight, easy-to-build web portal designed for an intern to master full-stack web development basics. The platform allows **Admins** (District Officers) to upload and manage the daily price list, while **Citizens** can view live prices, search items, and file simple complaints against overcharging retailers.

2. Key Database Structure (Database Schema)

The intern will generate these tables using Laravel Migrations:

- users:** Default Laravel auth table (Admins, Sub-admins).
- commodities:** Stores the product profiles (e.g., `id`, `name`, `Urdu name`, `unit` [e.g., `Kg`, `Litre`]).
- daily_prices:** Stores the actual rates for a specific day (e.g., `id`, `commodity_id`, `official_price`, `active_date`).
- complaints:** Stores citizen reports (e.g., `id`, `citizen_name`, `citizen_phone`, `shop_name`, `location_address`, `description`, `status` [`Pending`, `Resolved`]).

3. Step-by-Step Intern Assignment Sprints

Sprint 1: Base Setup, Authentication & Database Migrations (Days 1–5)

- Install Laravel, configure the `.env` file, and establish a local MySQL database connection.
- Create the database migrations for `commodities`, `daily_prices`, and `complaints` with foreign key constraints.
- Integrate the standard **Laravel Breeze** or default UI Auth scaffolding for the admin register/login panels.

Sprint 2: Admin Operations - Price List Management (Days 6–10)

- Build a restricted Admin Dashboard accessible only to logged-in users.
- Create standard CRUD resource controllers to allow Admins to ****Create, Read, Update, and Delete**** commodities.
- Design a simple form allowing the Admin to publish today's prices for registered items (updates the `daily_prices` table).

Sprint 3: Citizen Public View & Search Layout (Days 11–15)

- Create a public-facing home page where users do not need to log in.
- Display today's published price list in a clean HTML table styled with Bootstrap or Tailwind.
- Implement a simple search filter so users can type "Ata" or "Milk" to find official prices instantly.

Sprint 4: Citizens Complaint Form & Simple Reports (Days 16–20)

- Design a public **"File a Complaint"** form. Validate input fields (e.g., phone number must be 11 digits, description is required).
- Display incoming complaints chronologically inside the Admin Dashboard, along with a button to toggle status from "Pending" to "Resolved."
- Generate a simple metrics section on the Admin dashboard showing: *Total Complaints Received*, *Pending Actions*, and *Most Complained About Shop*.

4. Intern Evaluation Checklist

Requirement Area	Standard Task / Success Criteria	Priority
Security Validation	Ensure non-authenticated users cannot access the Admin pricing forms (using Laravel <code>auth</code> middleware).	High
Data Consistency	Form validations reject empty values, letters in numeric price fields, or invalid phone numbers.	High
Ease of Deployment	All table modifications must be executed using Laravel migration commands; database seeding loads sample data smoothly.	Medium
